

My example of a Cybersecurity Incident Report

Part 1: Provide a summary of the problem found in the DNS and ICMP traffic log

The network protocol analyzer logs indicate that port 53 is unreachable when attempting to access the client company's website. Port 53 is normally used for DNS service. This may indicate a problem with translating host name to IP address. It is possible that this is an indication of a malicious attack on the web server.

Part 2: Explain your analysis of the data and provide at least one cause of the incident

The incident occurred in the afternoon, when several customers of the client company reported an error when attempting to access the website as it was unable to load. The network security responded by running tests with the network protocol analyser tool tcpdump. The resulting logs revealed that port 53, used for DNS service, is not reachable. Every attempt resulted in the same error message, which may be a result of a DDoS attack.
